

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (Currently Amended) A device for arranging at least two bands around one or more packets comprising:

supply reels having a supply roll for a band of the strap type and a supply roll for a band of the film type;

a frame in a lying conveyor belt supported by the frame for moving the packets forward;  
band clamping and guiding means which move transversely of the conveyor belt away from and toward each other and which are connected to associated supply reels for the at least two bands, the band clamping and guiding means further are arranged for applying simultaneously the strap type band and the film type band one above the other around the one or more packets such that each band can be sought, fixedly clamped, welded together and separated;

welding means for welding together the bands which have been moved toward each other; and

the at least two types of bands comprising a band of the strap type and a band of the film type, wherein the band ~~clamping and~~ clamping, guiding means ~~and welding means includes~~ include a first group of band clamping and guiding means having a first pair of welding and clamping jaws arranged for the band of the strap type and a second group of band clamping and guiding means having a second pair of welding and clamping jaws arranged for the band of the film type, which groups are arranged one above the other.

2. (Canceled)

3. (Previously Presented) The device as claimed in claim 1, characterized in that the second band is wider than the first band.
4. (Previously Presented) The device as claimed in claim 1, characterized in that each jaw of the first pair of jaws has a clamping surface which runs transversely relative to the direction of movement and which co-acts with a counter-surface of an intermediate body carried by one of the jaws, wherein at least one of the surfaces is provided with tooth-like protrusions lying in a direction opposite to the pulling direction.
5. (Previously Presented) The device as claimed in claim 1, characterized in that each jaw of the second pair of jaws has a guide surface which runs transversely relative to the direction of movement and which co-acts in each case with a motor-driven supply roll.
6. (Previously Presented) The device as claimed in claim 1, characterized in that one of the band types is provided with a label.
7. (Withdrawn) Method for arranging at least two bands one above the other around one or more packets, wherein each band, which is formed by fastening together at their outer ends two bands unrolled in each case from a supply roll, is trained in a U-shape round the or each packet, whereupon each pair of band portions extending around the or each packet in a U-shape are pressed toward each other along the object, adhered to each other and severed such that a band again extends between each pair of supply rolls, characterized in that the type of the at least two bands is chosen according to the height on the one or more packets, and that for each band each of the two band portions pressed toward each other is fixedly clamped, moved toward each other, welded together and separated.
8. (Withdrawn) Method as claimed in claim 7, characterized in that each band of the bands to be arranged one above the other is fixedly clamped, welded together and separated simultaneously and in one movement.

**Appln No. 10/533,348**  
**Amdt date January 30, 2008**  
**Reply to Office action of October 30, 2007**

9. (Withdrawn) Method as claimed in claim 7, characterized in that each band of the bands to be arranged one above the other is successively sought, fixedly clamped, welded together and separated.
